Sequence 1, Application US/08142439A Patent No. 5670360 GENERAL INFORMATION:

APPLICANT: Thorens, TITLE OF INVENTION:

Receptor for the Glucagon-Like-Peptide-1 (GLP-1)

NUMBER OF SEQUENCES: 9

```

    No. is the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             of hits satisfying chosen parameters:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      is useful for screening compounds to identify regulators of GLP-2 receptor expression. The DNA construct is also useful for delivering a gene product to tissues selected from interstinal epithelium and the lateral hypothalamus, by transfecting an organism, or a gametic or embryonic form of such an organism, with the construct. The DNA construct is also useful to identify cells capable of mediating expression from the chosen GLP-2R promoter, to identify regions of the GLP-2R promoter that are functional in a given cell type, and to screen for agents that modulate expression from the GLP-2R promoter. It can be used to map functional regions of the GLP-2R promoter, and for screening agents that modulate the function of GLP-2R promoter.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence represents the 5' flanking and 5' UTR of the murine glucagon-like peptide-2 (GLP-2) receptor gene. This sequence may be used in the DNA construct of the invention, such that it is linked for expression with a heterologous gene of interest. This construct

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WO9300430-A.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       24-MAY-1993
                                                                                                                                                                                                                                                                                                                                  The human nov promoter contains several consensus sequences for different transcription factors such as NF1, AP1 and Sp1. It also comprises a sequence of 20 repeats of the TG motif (a possible polymorphic marker). See also AAQ36050 and AAQ36052.
                                                                                                                                                                                                                                                                                                                                                                                                  (i.e. 50% formamide, 5 x SCC). The promoter sequence from the human nov gene, localised to a 2.2kb PstI-HindII fragment and comprising the 283bp upstream of the start of including the start of sequence xxxIII disclosed. The promoter sequence corresponds to sequence xxxIII which is given as three separate fragments in the specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            07-JAN-1993

                                                                                                                                                                                                                                                                                                                      This polynucleotide comprises the 3' portion of a cDNA clone, designated AS63_29 (see also AAV30917), that codes for a novel human secreted protein (see AAW58381). AS63_29 was isolated from a human foetal brain cDNA library using methods selective for cDNAs that encode secreted proteins. The clone is deposited in composite clone ATCC 98232; an oligonucleotide (see AAT99723) is designed to isolate the clone from the composite. Novel cDNA clones (see AAV30916-32) coding for human secreted proteins (see AAW58580-90) are claimed. These can be used for recombinant production of the secreted
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Nucleic acid encoding secreted protein from human cells - useful, e.g. as immunomodulator, antitumour agent, promoters of tissue growth, haemostatic and thrombolytic agents etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Agostino MJ, Jacca

                                                                                                                                                                                                                                                                                                                                         Matches
                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                              proteins AAB90667 - AAB90750. The CDNA clones are isolated from various tissue types, and may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate protein expression. The polypeptides and nucleic acids may be used as nutrients or to modulate cytokine and cell proliferation/differentiation activity and may also be involved in modulation of the immune system. The CDNA sequences, proteins their agonists and/or antagonists exhibit haematopoiesis regulating activity; tissue growth activity; activin/inhibin activity; chemotactic/chemokinetic activity; haemostatic and thrombolytic activity; receptor/ligand activity; anti-inflammatory activity;
 Human; cytokine; cell proliferation; cell differentiation;
                           Human polynucleotide SEQ ID NO 8888.
                                                     06-NOV-2001 (first entry)
                                                                                                                                                                                                                                                                                                                                                                           haematopolesis activity; cadherin/tumour suppressor activity; and/or tumour inhibition activity. Included in the invention are probes represented in AAF98490 - AAF98572 which are specific for the cDNA clones

The polyneptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides are useful in gene therapy, the polypeptides are useful in gene therapy, activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activiny inhibin activity and may be useful in the diagnosis and/or treatment of cancer legislations according to the content of cancer legislations according to the content of cancer legislations are content of cancer legislations are content of cancer legislations are content of cancer legislations.

                                                              23638
                                                                                                                                                                                                                                                  amino acid sequences given in AAM82170 to AAM91921. (1) have cytostatic activity, and can be used in gene therapy and vaccine production. (1) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (1) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (1) by expressing inactive proteins or to supplement the patients own production of (1). Additionally, (1) polynucleotides may be used to produce the secreted (1), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (1) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metastases of haematopoietic-derived cells. AAK64703

                                                                                                                                                                                                                                                                                                                                              Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic cattivity, and can be used in gene therapy and vaccine production. (I) CC activity, and can be used in gene therapy and vaccine production. (I) CC proteins and polynucleotides may be used in the prevention, diagnosis and CC treatment of diseases associated with inappropriate (I) expression. For CC example, they may be used to treat disorders associated with decreased CC expression by rectifying mutations or deletions in a patient's genome CC that affect the activity of (I) by expressing inactive proteins or to CC supplement the patients own production of (I). Additionally. (I) CC supplement the patients own production of (I). Additionally. (I) CC polynucleotides may be used to produce the secreted (I), by inserting CC protein. (I) proteins and polynucleotides may be used to prevent, CC graces and treat immune/haematopoietic-related diseases, especially CC cancers and cancer metastases of haematopoietic antigen genomic CC sequences from the present invention. AAK54942 to AAK54950 and AAM82169 CC represent sequences used in the exemplification of the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to human polynucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to cytokine, cell proliferation or cell differentiation or which may induce production of other cytokines in other cell populations. The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, haematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activino/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and

                                                                                                                                                  expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting the nucleic acids into a host cell and culturing the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoletic-related diseases, especially cancers and cancer metastases of haematopoletic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoletic antigen genomic sequences from the present invention. AAK54942 to AAK54950 and AAM82169 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                         AAK54951 to AAK64702 encode the human immune/haematopoietic antigen (I) amino acid sequences given in AAM82170 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Nucleic acids encoding human immune/hematopoietic antigen polypeptides, useful for preventing, diagnosing and/or treating cancers and metastasis - \,

A259 is homologous with the alphal and alphal0 integrin subunits and is overexpressed in fibrosis. A259 is implicated in regulation of proliferation, differentiation and/or function of many different cell types. Inhibitors of A259 activity are useful for the treatment of liver disease, particularly fibrosis, and also fibrosis in other organs (specifically lung and kidney). In addition, A259 can be used for treatment and prevention of cancer, osteoporosis, acute myeloid of treatment and prevention of cancer, osteoporosis, acute myeloid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            which encode secreted proteins with homology to integrin alpha subunits, gecifically to integrin alpha 10. The A259 polypeptide and nucleic acid care useful for treating liver disease or fibrosis, particularly kidney cibrosis or lung fibrosis. The A259 polypeptide and nucleic acid are also useful for diagnosing, preventing or treating cartilage and bone cassociated disorders (such as bone cancer, achondroplasia, myeloma, fibrous dysplasia, scoliasis, osteoarthritis, osteoarcoma and costeoporosis), bone marrow, blood and haematopoietic disorders (such as acute myelodid leukaemia, haemophilia, anaemia and thalassaemia), immune cautoimmune disorders e.g. AIDS, and allergic inflammatory disorders e.g. athma and psoriasis), apoptotic disorders (such as systemic lupus carthmatosus and insulin-dependent diabetes mellitus), diseases of the neuronal tissues (such as epilepsy and muscular dystrophy) and carthmatoric such as epilepsy and muscular dystrophy.

                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel protein (I) of the stomatin family which can be used in the treatment of pain. (I) is involved in transduction of mechanical stimuli to a receptor potential, particularly in perception of pain and contact, so when the function of (I) is reduced, so will be sensitivity to pain. (I) and other members of the stomatin family, are used as target proteins for treatment of pain, and especially: (1) for the development of analgesics and anesthetics, e.g particularly for pharmaceutical development; (3) for developing diagnostic kits for predicting an individual's response to different analgesics/anesthetics or disposition to side effects, and (4) for determining disposition to disease. This sequence encodes the murine stomatin protein described in the method of the invention.

cc amino acid sequences given in AAM82170 to AAM81921. (1) have cytostatic contribute, and can be used in gene therapy and vaccine production. (1) crotesins and polynucleotides may be used in the prevention, diagnosis and ctreatment of diseases associated with inappropriate (1) expression. For cc example, they may be used to treat disorders associated with decreased cc expression by rectifying mutations or deletions in a patient's genome cc that affect the activity of (1) by expressing inactive proteins or to supplement the patients own production of (1). Additionally, (1) cc polynucleotides may be used to produce the secreted (1), by inserting cc the nucleic acids into a host cell and culturing the cell to express the cc diagnose and treat immune/haematopoietic antigen genomic concers and cancer metastases of haematopoietic antigen genomic concerns terminate present invention. AAK54922 to AAK87694 represent invention. AAK54942 to AAK54950 and AAM82169 cc represent sequences sized in the example first the Concerns and cancer metastase of the concerns and cancer metastases of haematopoietic antigen genomic concerns according to the present invention. AAK54942 to AAK54950 and AAM82169
